Overview

Introduction

- □ The Sentinel-1 SAR Instrument
- S-1C&D Upgraded Antenna architecture

□ The new Tile Amplifier

- Internal Calibration improvements
- Improvements on Noise estimation
- □ FM tiles on-ground test results

Summary

CEOS Cal Val 2019 | 22/11/2019 | Slide 2

ESA UNCLASSIFIED - For Official Use

Introduction

- Sentinel-1A launched on 3rd April 2014.
- Sentinel-1B launched on 25th April 2016.
- Sentinel-1C & -1D contract kicked off in 2015 to extend observations beyond the lifetime of Sentinel-1A and -1B (design lifetime: 7.25 years in orbit).
- Sentinel-1C launch is targeted for 2022*
- S-1A, B, C and D are fully compatible in terms of mode characteristics, observation geometry, resolution and burst synchronisation (interferometry).

The Sentinel-1 SAR Instrument

SAR Antenna Subsystem (SAS)

- Active phased array antenna
- 12.3 m x 0.84 m aperture
- 2 wings, 5 Panels
- 14 Tiles each with 20 H & 20 V slotted dual polarized waveguide arrays
 - 2 x 280 T/R modules
 - = 10 *Electronic Front Ends* (EFEs) per tile, each with 2 TRMs x 2 (H & V)
 - 2 (cold redundant) Tile Amplifiers per tile

Integrated Central Electronics (ICE) (part of the SAR Electronics Sub-system SES)

- Digital Chirp Generator
- Real sampling, Digital demodulation & filters
- Flexible Dynamic Block Adaptive Quantisation

Slide 4

Upgraded Antenna Architecture (1 of 2)

S1A&B TA

■S1A&B: TA built rnm Transmit/Receive Modules as in Frontend optimal Levels, significa<u>nt i</u>nternal cross talk Needs internal calibration with 5 Measurements.

S1C&D TA

ESA UNCLASSIFIED - For Official Use

CEOS Cal Val 2019 | 22/11/2019 | Slide 5

Upgraded Antenna Architecture (2 of 2)

The S1A&B instrument architecture was reviewed to identify potential improvements.

New TA design provides:

- Improved radiometric stability and accuracy.
- Simplification of internal calibration scheme.
- Reduction of RF hardware complexity.
 Transmit Gain Unit TGU is no longer required.
- Simplification of trimming for the long RF networks from SES to the tiles.
- Slight improvement in the instrument noise figure.

S1-C/D SES Panel

Internal Calibration Improvements

The new Tile amplifiers simplify the internal calibration approach: $PGCal = \frac{TxCal * RxCal * TACal}{EPDNCal * APDNCal}$ S1A&B Status:

S1C&D Status:

 $PGCal = \frac{TxCal * RxCal}{}$ FPDNCal

- Lower number of measurements \rightarrow lower calibration inherent errors
- Reduced cross talk within new TAs \rightarrow better calibration stability
- Predicted Radiometric Stability of S1A&B: $0.55 \text{ dB} (3\sigma)$
- Predicted Radiometric Stability of S1C&D: 0.40 dB (3σ)

Internal Calibration Scheme (1 of 3)

TXCal

- Signal has same TX path as imaging signals (red).
- Receive path (green) includes a 70 dB attenuator in addition to the nominal RX path.
- TXCal provides useful data on one RX channel only.

| 🖕 :: 🖛 🕂 || | 🗮 🚝 🚍 || || || 🚍 🚍 :: 🖬 🛶 🔯 || | 🚍 :: 🖽 🗰 💥

Internal Calibration Scheme (2 of 3)

RXCal

- Signal is operated with low gain on the TX path (red).
- Receive paths (green and blue) are operated with high gain, identical to imaging operation.
- RXCal provides useful data on H and V-pol RX channels

ESA UNCLASSIFIED - For Official Use

Internal Calibration Scheme (3 of 3)

EPDNCal

- operated with low gain on the TX path (red), same as for RXCal.
- Receive paths (green and blue) bypass the amplifiers within the front end.
- RX amplifiers are operated with high gain, identical to imaging operation.
- EPDNCal provides useful data on H and V-pol RX

Improvements on Noise estimation (1 of 3)

- Noise within the SAR signals includes significant amount of thermal radiation from ground (surface "brightness Temperature")
- Variations on thermal radiation changes overall noise levels up to 1 dB.
- Radar data takes include dedicated noise measurements in Preamble and Postamble of data takes.
- Radiometric accuracy in images can be improved when acquiring actual noise power of the imaged scene. **

**) Cross-Sensor Calibration of Sentinel-1 Noise Level, N. Franceschi (2D4)

Improvements on Noise estimation (2 of 3)

- Interleaved Noise data within a data take can be extracted from first data packets acquired after internal calibration sequences
- "Clean" noise data can be acquired after RXCal and EPDNCal
- TXCal emits a boresight beam which contaminates noise in following Rank PRIs.

Updates for S-1C&D:

- Wave Mode: dedicated noise acquisitions added to each vignette
- Stripmap: typically short data takes without interleaved calibration pulses, no extra noise measurements added.
- IW and EW modes: Two approaches have been considered:
 - Continue using Rank Echoes: Changed the calibration sequence to minimise the impacts of TXCal signals.
 - Interleaving Noise Measurements with BAQ-5.

Tile FM on-ground test results (1 of 4)

The nominal test flow covers the following test cases:

- Functional
- Performance
- Temperature Compensation
- Mechanical/Vibration
- Thermal Cycling

PFM vs. FM:

- PFM-C used to qualify the new tile design.
- FM acceptance test showed excellent results.

CEOS Cal Val 2019 | 22/11/2019 | Slide 20

Summary

- S-1C&D ensures continuity of data products with S-1A&B.
- Antenna architecture of S-1C&D is updated with dedicated Tile Amplifiers.
- New TA simplifies internal calibration measurements.
- Instrument operation for S-1C&D is updated to improve noise acquisitions within IW, EW and WV mode.
- Eight FM Tiles have been successfully tested.
- Tile Test results show good calibration stability.
- New architecture is expected to provide improved SAR level radiometric stability and accuracy.
